PYTHON + POWER BI

1-Hour Daily Python & Power BI Plan for Working Professionals

An 8-week plan built for people with a full-time job. One hour on weekdays, with a mini task every week and one project at the end.

INSIDE THIS PDF · 6 PAGES

- How the hour is split
- Weeks 1 to 4: Python
- Weeks 5 to 8: Power BI
- The week 8 project
- Rules for busy weeks

How the hour is split

The same structure every weekday. It keeps you consistent when work gets busy.

- **10 minutes: revise**

  Re-do yesterday's task from memory.

- **20 minutes: learn**

  One concept only. Docs, a short video or a chapter.

- **30 minutes: build**

  Apply it to your practice dataset. This is where learning sticks.

- **Weekends**

  Optional. 1-2 hours to finish the week's mini task, or rest.

Practice dataset: pick one sales or HR dataset and use it for all 8 weeks, in both Python and Power BI.

@thedataguy16

Weeks 1 to 4: Python

Monday to Friday, one hour a day.

- **Week 1: Python basics**

  Variables, lists, dicts, loops, functions. Mini task: a function that calculates growth %.

- **Week 2: Pandas basics**

  read_csv, info, filtering, sorting, new columns. Mini task: load and clean your dataset.

- **Week 3: Pandas analysis**

  groupby, merge, pivot_table, dates. Mini task: answer 5 business questions.

- **Week 4: Charts and automation**

  Bar and line charts, saving output to Excel. Mini task: a script that produces a monthly summary file.

@thedataguy16

Weeks 5 to 8: Power BI

Same hour, now turning analysis into dashboards.

Week 5: Power Query

Load data, fix types, remove duplicates, unpivot. Mini task: a clean model-ready table.

Week 6: Data model and DAX

Star schema, Date table, SUM, DIVIDE, CALCULATE. Mini task: 6 core measures.

Week 7: Time intelligence and visuals

YTD, last year, YoY %, cards, line, bar, matrix, slicers. Mini task: a one-page dashboard.

Week 8: Project and publish

Combine Python cleaning with Power BI reporting. Publish and write a short README.

@thedataguy16

The week 8 project

This links both tools the way many teams actually use them.

Python step

A script that reads raw monthly files, cleans them and saves one clean CSV.

Power BI step

Load the clean CSV, build the model and measures, design the dashboard.

Refresh step

Next month: run the script, click Refresh in Power BI. The whole report updates.

What to show in interviews

"I built a monthly report pipeline: Python cleaning plus a Power BI dashboard, refreshed in under 5 minutes."

Rules for busy weeks

You will miss days. These keep the plan alive.

- **Never skip twice**
  Miss one day, fine. Never miss two in a row.
- **15-minute minimum**
  On bad days, just do the 10-minute revision and 5 minutes of building.
- **Same time every day**
  Before work or right after dinner. Habit beats motivation.
- **Use your work data, safely**
  Practise on similar public data, then apply the skill at work. Never take company data home.

After 8 weeks: 40 hours of focused practice, 8 mini tasks and one end-to-end project. Enough to start using both tools at work.
