AI · CAREER

Everyone is talking about AI. No one tells you what you need to learn.

The exact skills, in the right order. 3 levels, 1 roadmap.

@thedataguy16

Most iobs need levels 1 and 2. Level 3 is for builders.

Pick your level

Trying to learn everything is why most people stall. Know where you are going.

LEVEL 1 · EVERYONE

Use AI well

Clear prompts · check every output · keep company data private · know where AI is weak

LEVEL 2 · DATA & TECH ROLES

Work with AI

AI for SQL, Python and analysis · understand tokens, context window, hallucination

LEVEL 3 · BUILDERS

Build with AI

Call models from code · JSON output · embeddings · RAG · agents · evaluation

🚫 **Not needed for most jobs**
Training large models from scratch. That is research work.

@thedataguy16

Prompt like a pro

Use these 5 parts for almost any task. The last one catches most mistakes.

ROLE You are a senior data analyst.

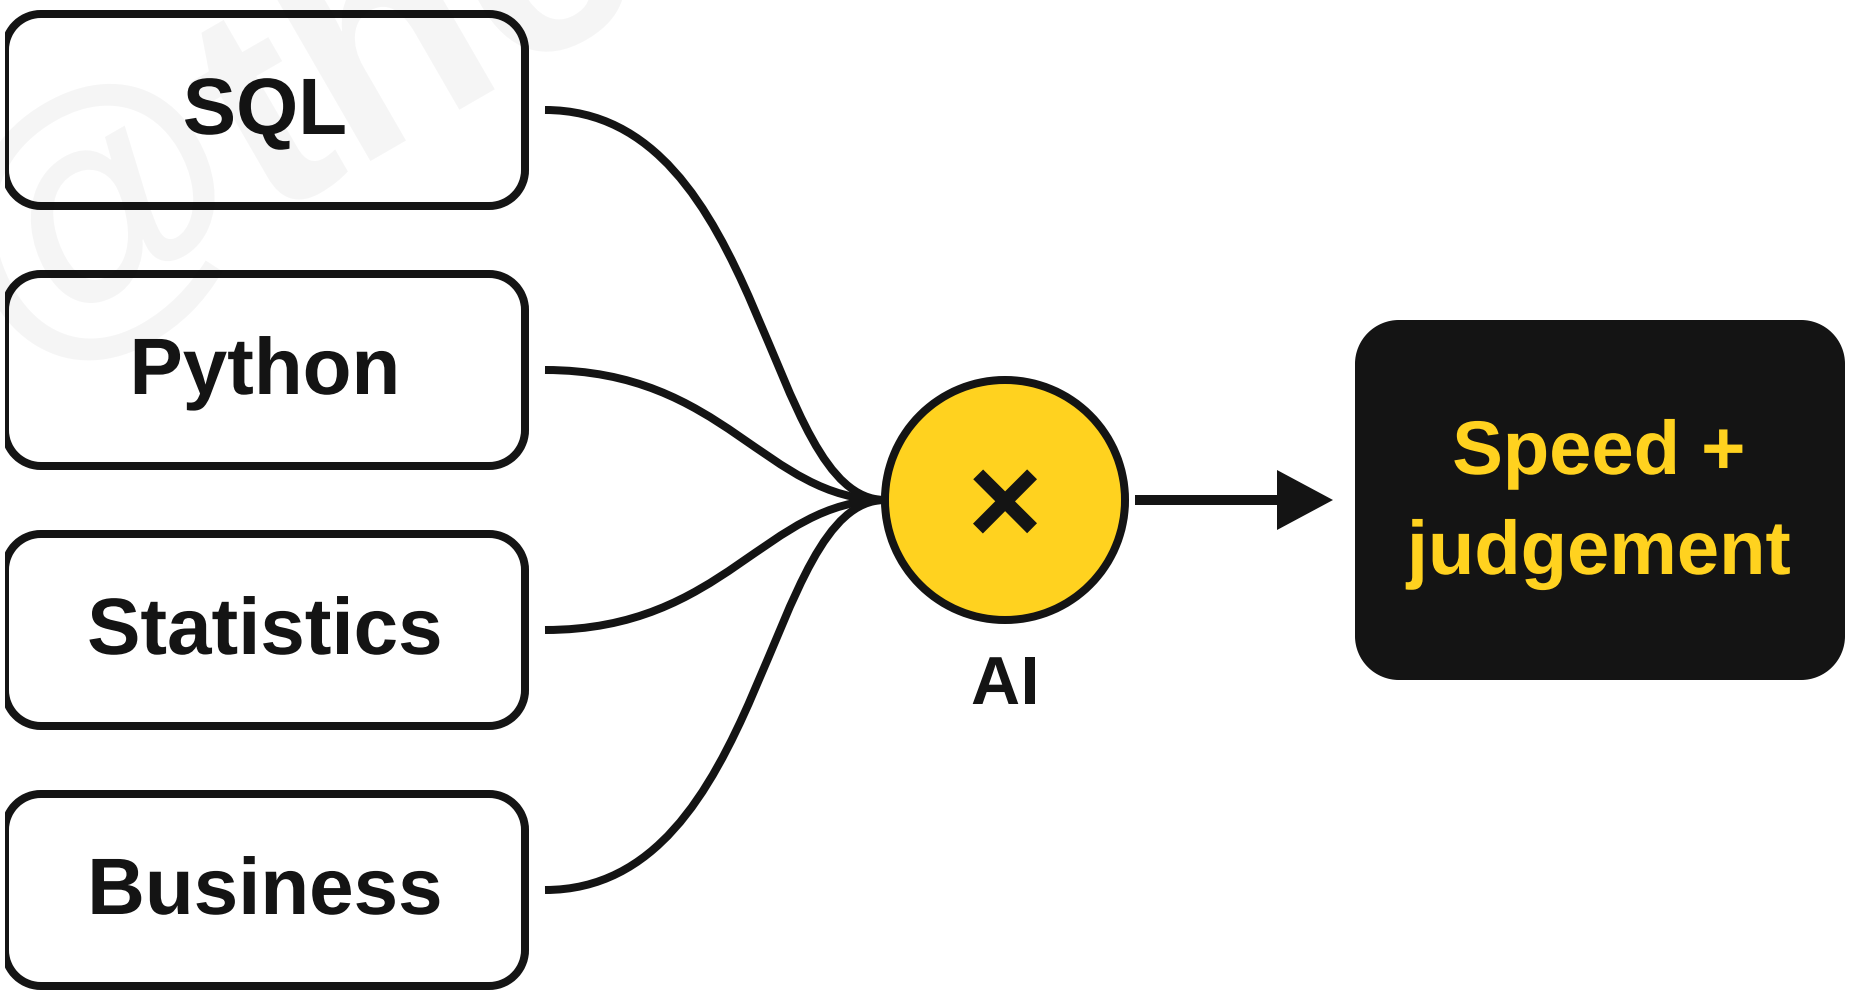

CONTEXT Table sales: order_id, order_date, region, amount.

TASK Month-on-month revenue growth % by region.

FORMAT PostgreSQL, one line per step.

CHECK List 2 ways this could be wrong.

AI multiplies your skills

If you cannot check the answer, you cannot safely use it.

How AI actually works

The 5 terms that come up in interviews and at work.

Token

The unit of text a model reads and writes. Usage is counted in tokens. (Split below is illustrative.)

Context window

How much text the model can consider at once: prompt + reply.

Temperature

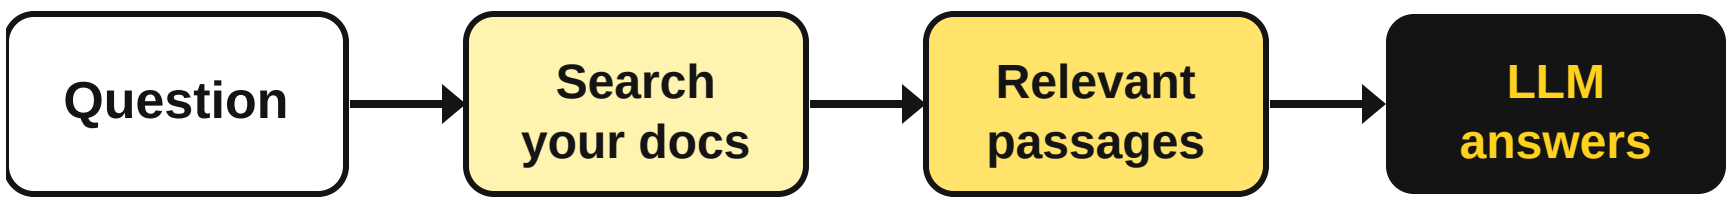

Randomness. Low: consistent. High: varied.

Hallucination

A confident answer that is wrong. This is why checking output is a core skill.

RAG: answers from your documents

Grounds answers in real sources, which reduces made-up facts.

Your 90-day plan

One hour a day. Follow the order.

1

DAYS 1-15

Use AI daily at work

Practise the 5-part prompt. Check every output.

2

DAYS 16-45

Strengthen the foundations

SQL, Python, statistics. AI as tutor, not answer key.

3

DAYS 46-60

Understand how AI works

Learn the 5 terms. Classify 50 rows of real text, then check accuracy by hand.

4

DAYS 61-90

Build one small AI project

Call a model from Python, get JSON output, build a simple RAG search on your own documents.

Skip for now

× Training LLMs from scratch
× Deep transformer maths
× Chasing every new tool

The skill companies want most: knowing when the AI is wrong.
