# PYTHON

## FILES AND FOLDERS

By @thedataguy16

1 *Imports for this page*

```
import shutil, pandas as pd
```

2 *Paths made easy*

```
from pathlib import Path
```

3 *Today's date*

```
from datetime import date
```

4 *Every Excel file in a folder*

```
files = list(Path("reports").glob("*.xlsx"))
```

5 *Make a folder if missing*

```
Path("output").mkdir(exist_ok=True)
```

6 *Rename a file*

```
Path("old.csv").rename("new.csv")
```

7 *Copy a file*

```
shutil.copy("sales.xlsx", "output/sales.xlsx")
```

8 *Does the file exist?*

```
Path("sales.xlsx").exists()
```

9 *File name without .xlsx*

```
Path("jan_sales.xlsx").stem
```

10 *Date-stamped file name*

```
f"report_{date.today():%Y%m%d}.xlsx"
```

# PYTHON

## EXCEL WORK, DONE

By @thedataguy16

11 *Read one sheet*

```
df = pd.read_excel("sales.xlsx", sheet_name="Jan")
```

12 *Read every sheet*

```
sheets = pd.read_excel("sales.xlsx", sheet_name=None)
```

13 *Stack all sheets*

```
df = pd.concat(sheets.values(), ignore_index=True)
```

14 *Combine every file*

```
df = pd.concat(pd.read_excel(f) for f in files)
```

15 *Save to Excel*

```
df.to_excel("output/final.xlsx", index=False)
```

16 *Save as CSV*

```
df.to_csv("output/final.csv", index=False)
```

17 *Pivot, like Excel*

```
df.pivot_table(index="region", values="sales", aggfunc="sum")
```

18 *VLOOKUP, the pandas way*

```
df.merge(prices, on="product", how="left")
```

19 *Remove duplicate rows*

```
df = df.drop_duplicates()
```

20 *Trim extra spaces*

```
df["name"] = df["name"].str.strip()
```

# pandas

by @thedataguy16

| # | How do I... | pandas |
|---|---|---|
| 21 | Count blanks per column | `df.isna().sum()` |
| 22 | Count rows per city | `df["city"].value_counts()` |
| 23 | Turn text into dates | `df["date"] = pd.to_datetime(df["date"])` |
| 24 | Total sales by month | `df.groupby(df["date"].dt.month)["sales"].sum()` |
| 25 | Fill blank sales with 0 | `df["sales"] = df["sales"].fillna(0)` |
| 26 | Keep sales above 1000 | `df[df["sales"] > 1000]` |
| 27 | Sort, highest first | `df.sort_values("sales", ascending=False)` |
| 28 | Top 5 rows by sales | `df.nlargest(5, "sales")` |
| 29 | Add a total column | `df["total"] = df["qty"] * df["price"]` |
| 30 | Capital letters | `df["city"] = df["city"].str.upper()` |
| 31 | Split full names | `df["name"].str.split(" ", expand=True)` |
| 32 | Rename a column | `df = df.rename(columns={"qty": "units"})` |
| 33 | Drop a column | `df = df.drop(columns=["email"])` |
| 34 | Percent of total | `df["sales"] / df["sales"].sum() * 100` |
| 35 | Running total | `df["sales"].cumsum()` |
| 36 | Round to 2 decimals | `df["sales"].round(2)` |
| 37 | Find repeated customers | `df[df.duplicated("customer_id", keep=False)]` |
| 38 | Rows and columns | `df.shape` |

☆ THE 90-DAY SYSTEM · 5.0 BEST SELLER

# Become a data analyst in 90 days.

Open it every morning. It tells you what to learn, build and ship that day. 1 hour a day, no coding background needed.

**27** portfolio projects with real data

**100+** interview Q&As with model answers

**365** days of 1:1 mentor access

**10+** job applications sent by Day 90

**0 to job-ready, one day at a time**

Built by Abhishek · 7 yrs in data · 31,000+ helped
