Model it right

- **Star schema**
  1 fact table, dimensions around it
- **One-to-many**
  Single direction filters
- **Date table**
  Mark it as date table

DAX you will use

```
Total = SUM(Sales[Amt])

North = CALCULATE([Total],
  Region[Name]="North")

% Total = DIVIDE([Total],
  CALCULATE([Total],
ALL(Region)))

LY = CALCULATE([Total],

SAMEPERIODLASTYEAR('Date'[Date]))
```

Measure vs column

- **Column**
  Row by row, stored, for slicing
- **Measure**
  At query time, for totals and KPIs
- **SUM vs SUMX**
  SUMX goes row by row first

Most asked

- Filter vs row context
- What CALCULATE does
- Import vs DirectQuery
- Row Level Security
- How to speed up a slow report
